

P.E.T. & Plastics Recovery - Photographic Film Recycling

Introduction

Gemmark has a secure, reliable, and convenient way to process large volumes of silver bearing and non-silver bearing plastics and film. Gemmark is the world leader in recovery and refinement of silver and polyester-bearing material for the photographic industry.

Services

Through our high-technology polyethylene terephthalate (PET) recycling center, Gemmark provides clients with a high quality recycling service in an environmentally friendly manner. Our proprietary washing process removes coatings and impurities from film. Examples of end products that can be used as a result of our process are optical films, engineering resins, and fiber products. These end products can then be recycled into a new product. This allows the original

manufacturer to use the recycled material, thereby increasing profits and reducing expenses.

To meet the silver and polyester recovery and recycling demand we continue to develop proprietary, efficient and advanced systems to recover and recycle silver and polyester.

We have the ability to recover precious metals from even the lowest precious metal content materials. All materials are kept confidential and secure, and all requirements and regulations are adhered to.

Common Materials

- Silver-bearing film such as lithographics (virgin, exposed and news), X-ray (medical, jacketed and industrial), dry view, microfilm, acetate, electrolytic-based film and silver flake.

- Silver-bearing materials including emulsions, cartridges, canisters, filter and cores, resins and sludge.

- Polyester including polyethylene terephthalate (PET), and acetate.

Environment

By offering recycling services, we help organizations reduce the quantity of by products and waste that are normally disposed of in landfills. For silver bearing materials in many cases we create revenue for an organization because a return on the material is gained instead of a disposal invoice.

Who We Are

Gemmark Corporation is the leading provider of recovery and refinement of silver and polyester-bearing material for the photographic industry. We offer the best returns due to our proprietary knowledge and experience.
